

CHANNEL-COVE

WATER DIVERTER & MOISTURE BARRIER

Channel-Cove is a seamless water diverter that keeps water in the drain and off the basement floor. Once the interior drainage pipe is set, Channel-Cove is laid on top of the footer, covering the gravel bed.

The Channel-Cove then creates a pathway between the weep holes drilled into the wall and the newly re-poured concrete floor. Fluted channels collect any water from the wall and weep holes and direct it under the floor into the drainage system.

The smooth white facing is attractive and can be trimmed with Channel-Cove cap molding for a clean, professional finish.

- Tough high molecular weight material
- 250 ft. of seamless product per roll
- Pre-scored for 10" x 5" angle
- Easy installation
- Collects and directs
- Works as a diverter and a non-permeable moisture barrier in one product
